

Structure of the lecture

Software Improvement Group

39 | 112

PATTERNS

Coding style and coding standards

40 | 112

- E.g. layout, identifiers, method length, ...

Secure coding guidelines

- E.g. SQL injection, stack trace visibility

Bug patterns

- E.g. null pointer dereferencing, bounds checking

Code smells

- E.g. “god class”, “greedy class”, ..

Patterns

Style and standards

Software Improvement Group

Checking coding style and coding standards

41 | 112

- Layout rules (boring)
- Identifier conventions
- Length of methods
- Depth of conditionals

Aim

- Consistency across different developers
- Ensure maintainability

Tools

- E.g. CheckStyle, PMD, ...
- Integrated into IDE, into nightly build
- Can be customized

Checking secure coding guidelines

42 | 112

- SQL injection attack
- Storing and sending passwords
- Stack-trace leaking
- Cross-site scripting

Aim

- Ensure security
- Security = Confidentiality + Integrity + Availability

Tools

- E.g. Fortify, Coverity

Detecting bug patterns

43 | 112

- Null-dereferencing
- Lack of array bounds checking
- Buffer overflow

Aim

- Correctness
- Compensate for weak type checks

Tools:

- e.g. FindBugs
- Esp. for C, C++

Run PMD / Checkstyle / FindBugs

44 | 112

- E.g. on a project of your own
- E.g. on some (easy-to-compile) open source project

Inspect results

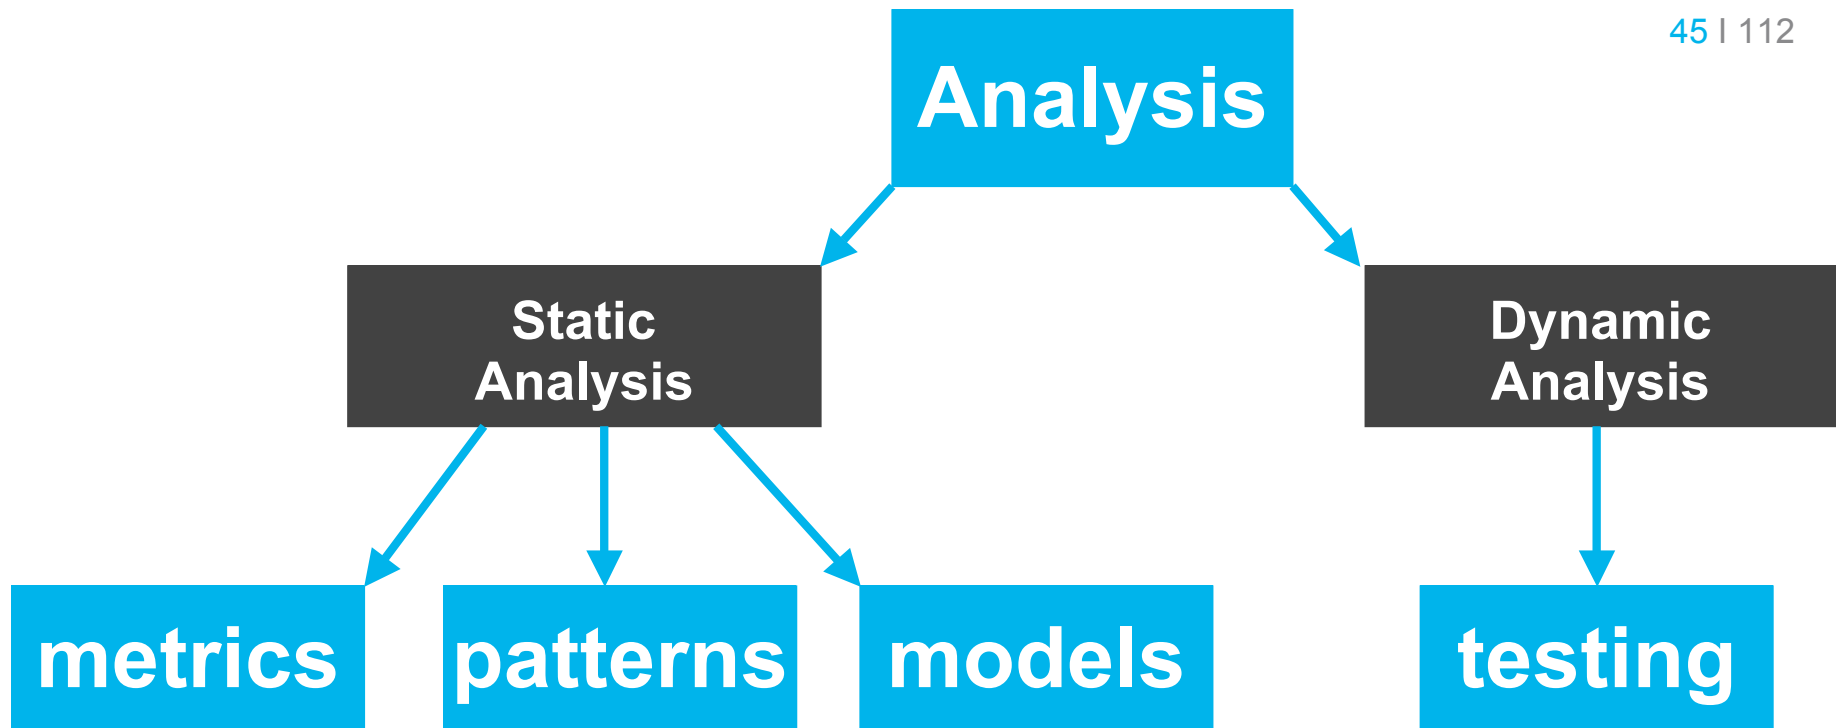

- False or true positives?

METRICS & QUALITY

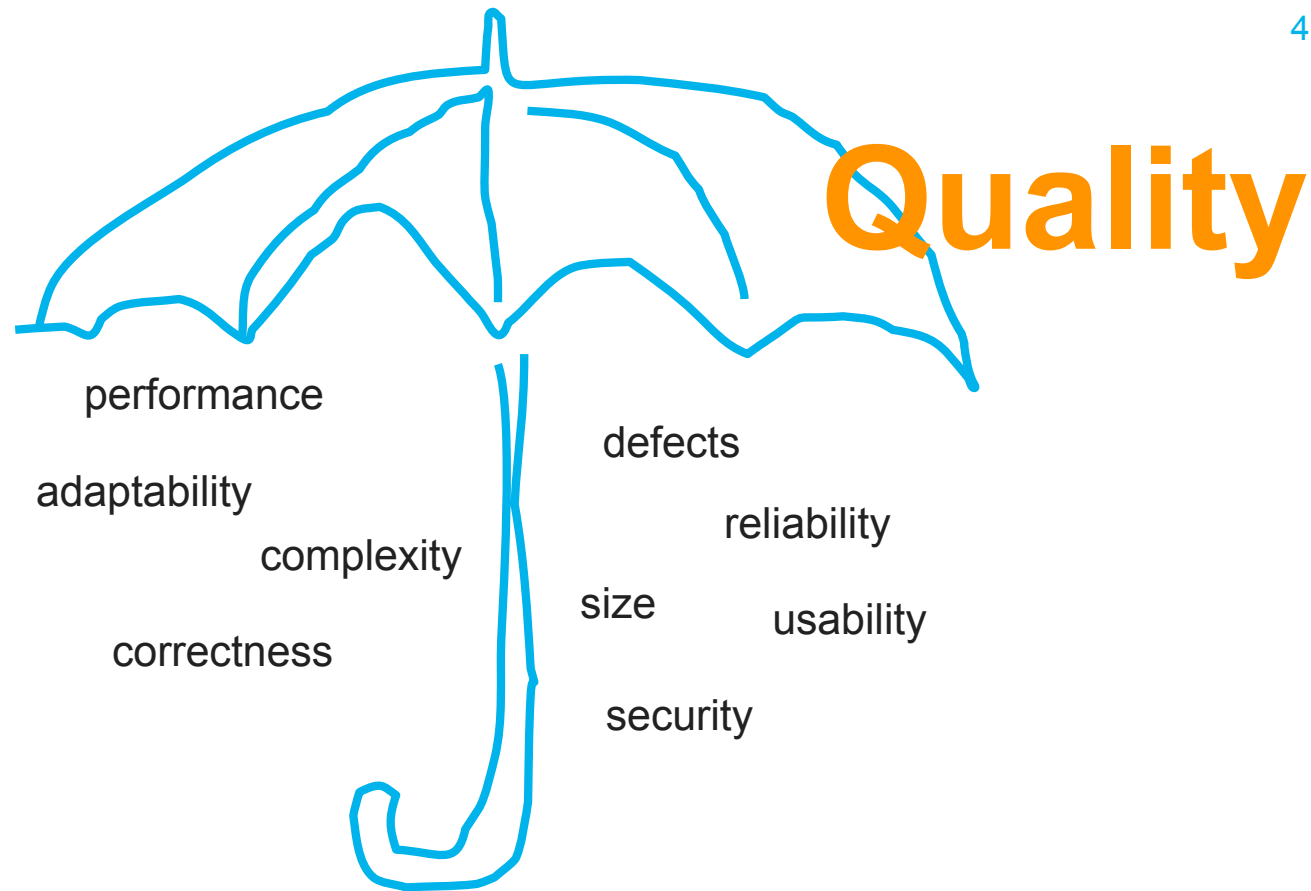

Software analysis

What?

Software Improvement Group

47 | 112

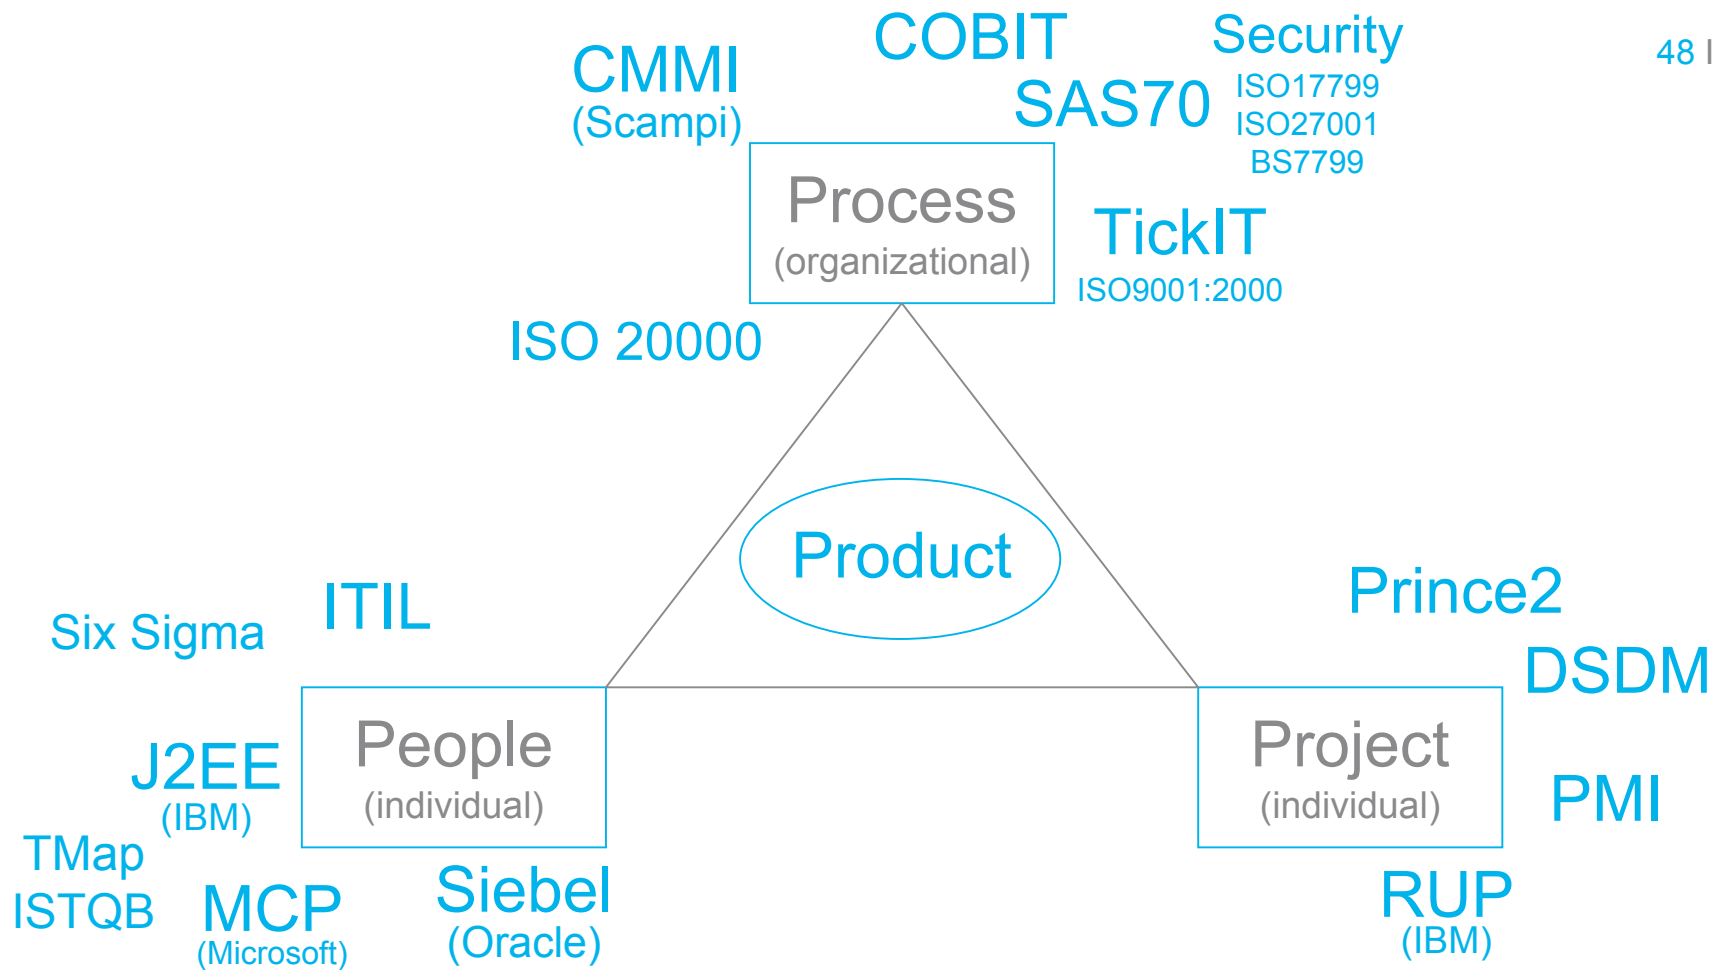

The bermuda triangle of software quality

Software Improvement Group

48 | 112

Capability Maturity Model® Integration (CMMI®)

49 | 112

- “... is a process improvement approach that provides organizations with the essential elements of effective processes..” (SEI)
- CMMI for Development (CMMI-DEV), Version 1.2, August 2006.
- consists of 22 process areas with capability or maturity levels.
- CMMI was created and is maintained by a team consisting of members from industry, government, and the Software Engineering Institute (SEI)
- <http://www.sei.cmu.edu/cmmi>

The Standard CMMI Appraisal Method for Process Improvement (SCAMPI)

- “... is the official SEI method to provide benchmark-quality ratings relative to CMMI models.”

Software Quality Process

51 | 112

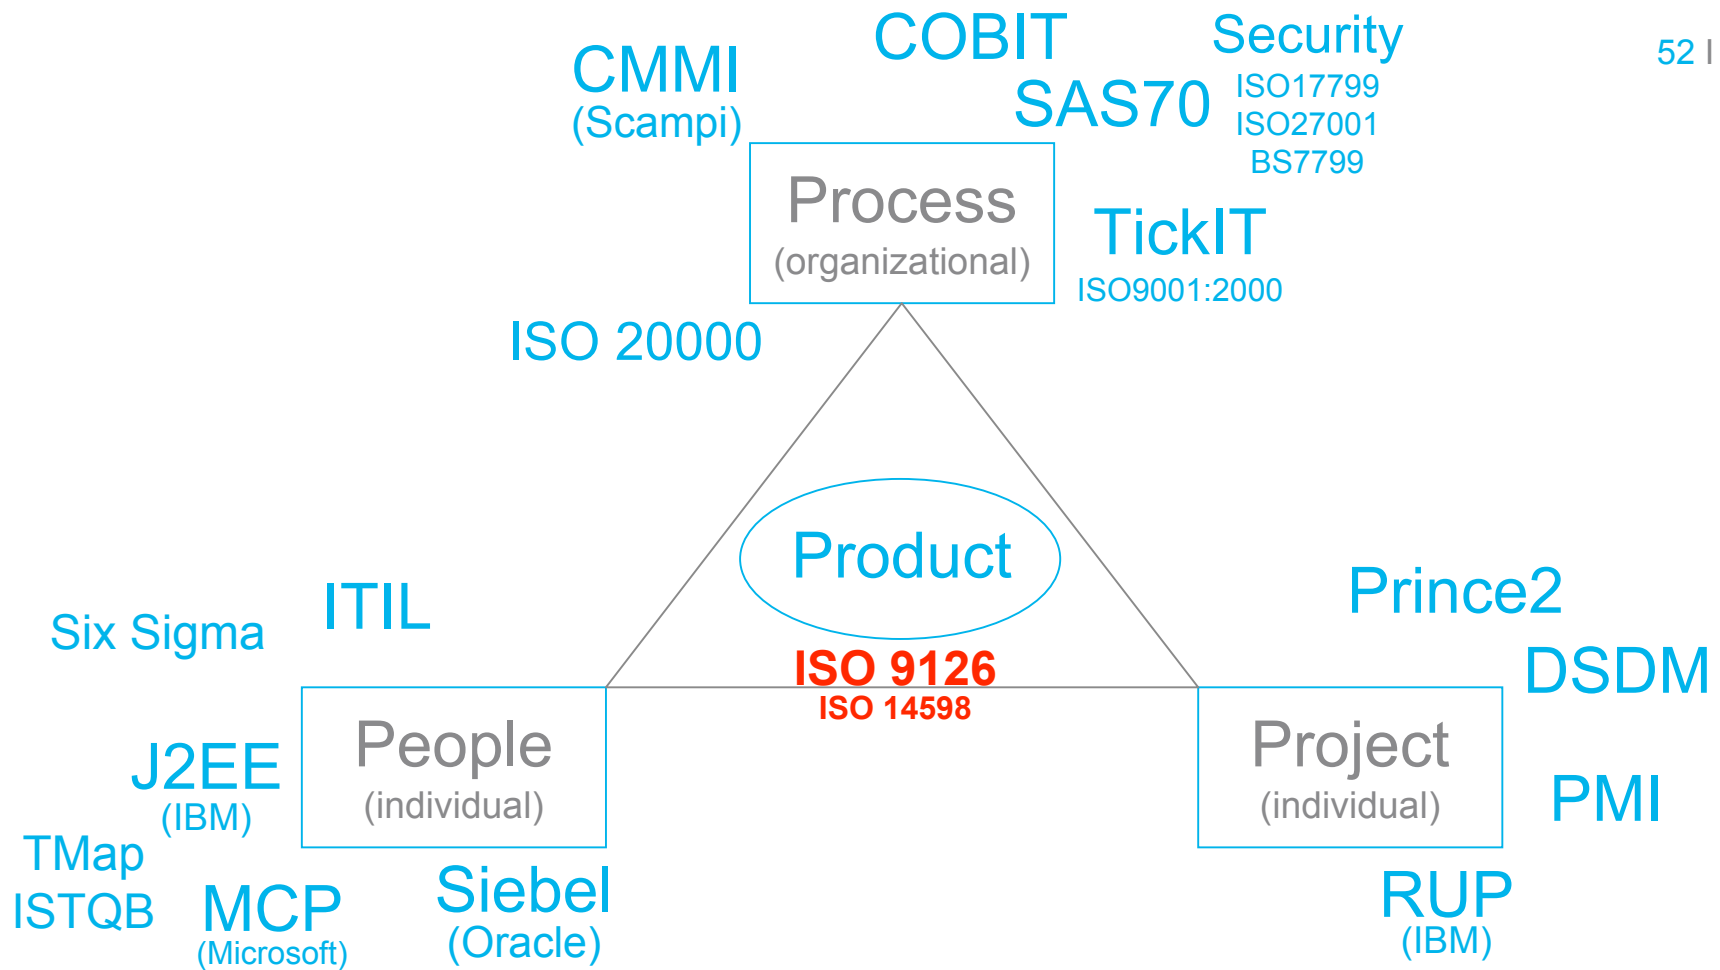

The bermuda triangle of software quality

Software Improvement Group

52 | 112

But ...

Software Improvement Group

53 | 112

What is software quality?

What are the technical and functional aspects of quality?

How can technical and functional quality be measured?

ISO/IEC 9126

54 | 112

Software engineering -- Product quality

1. Quality model
2. External metrics
3. Internal metrics
4. Quality in use metrics

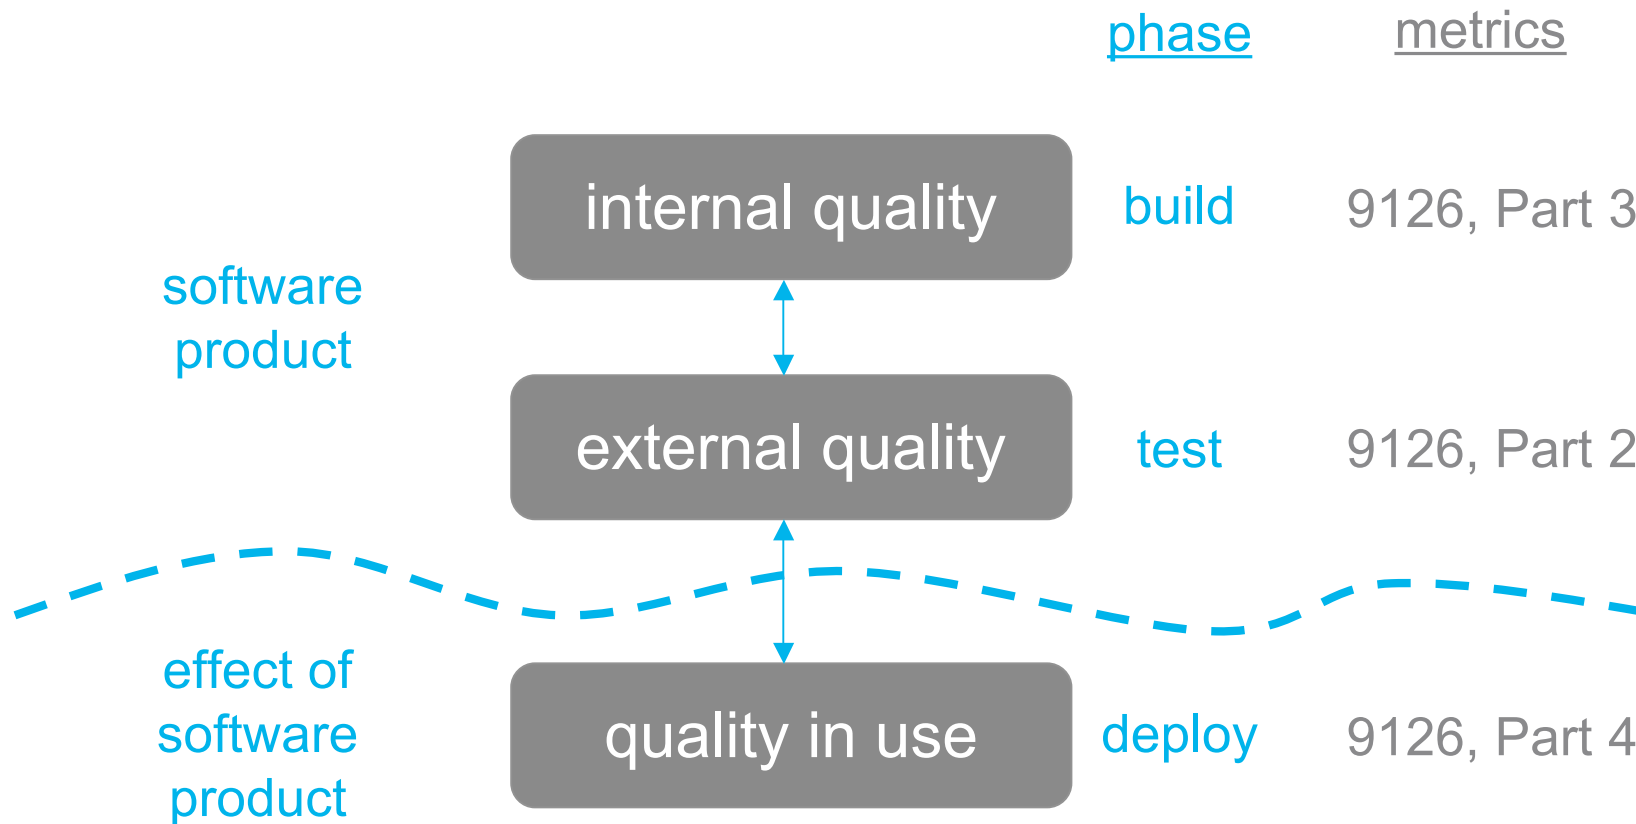

ISO/IEC 14598

Information technology -- Software product evaluation

1. General overview
2. Planning and management
3. Process for developers
4. Process for acquirers
5. Process for evaluators
6. Documentation of evaluation modules

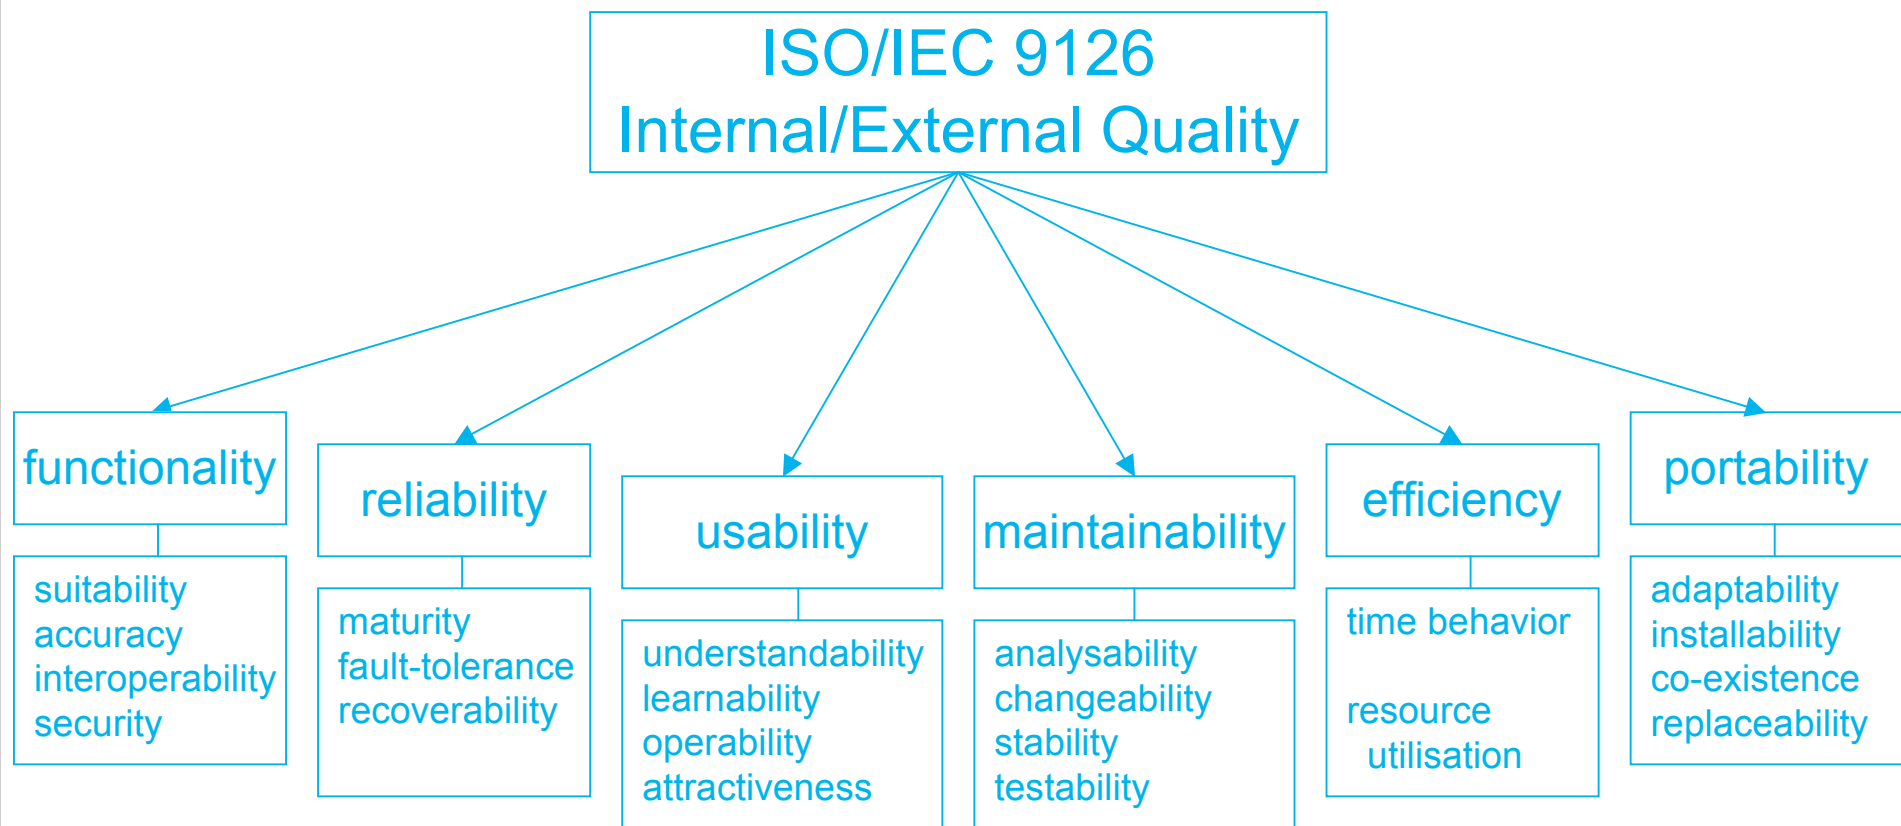

ISO/IEC 9126, Part 1

Quality perspectives

ISO/IEC 9126, Part 1

Product quality model: internal and external

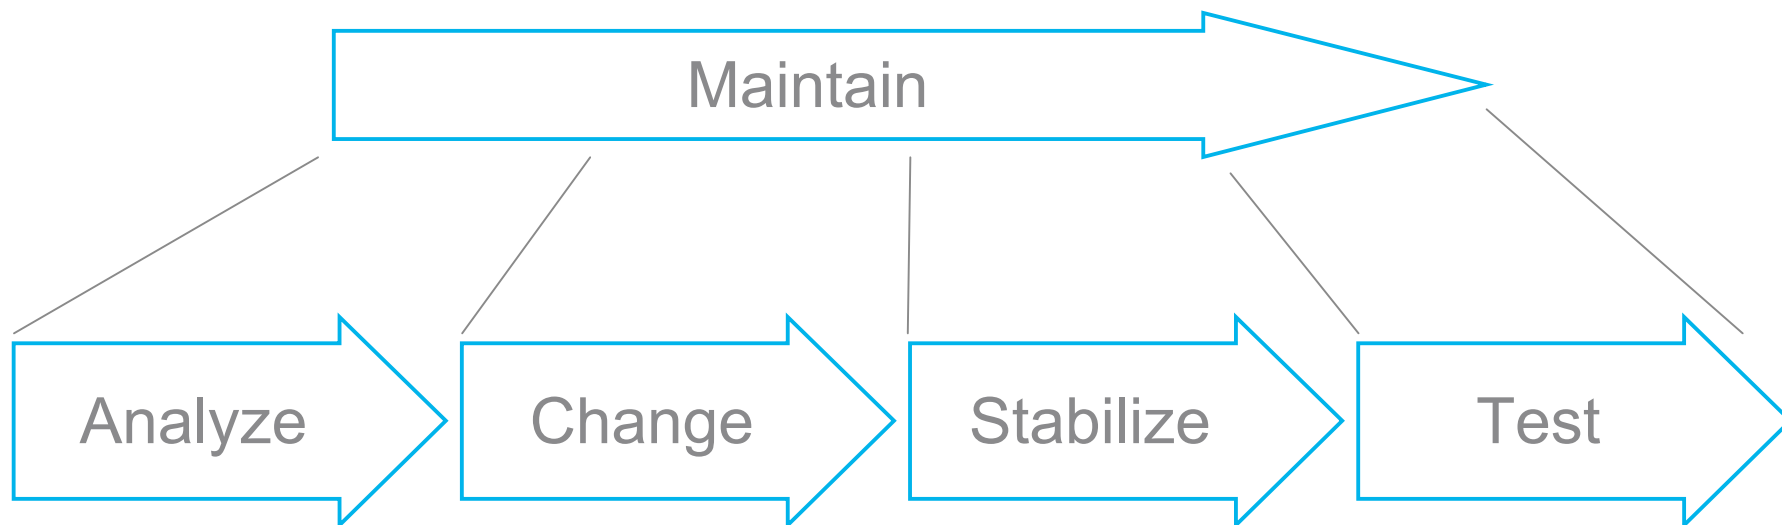

ISO 9126, Part 1

Maintainability (= evolvability)

Maintainability =

57 | 112

- *Analyzability*: easy to understand where and how to modify?
- *Changeability*: easy to perform modification?
- *Stability*: easy to keep coherent when modifying?
- *Testability*: easy to test after modification?

Reliability =

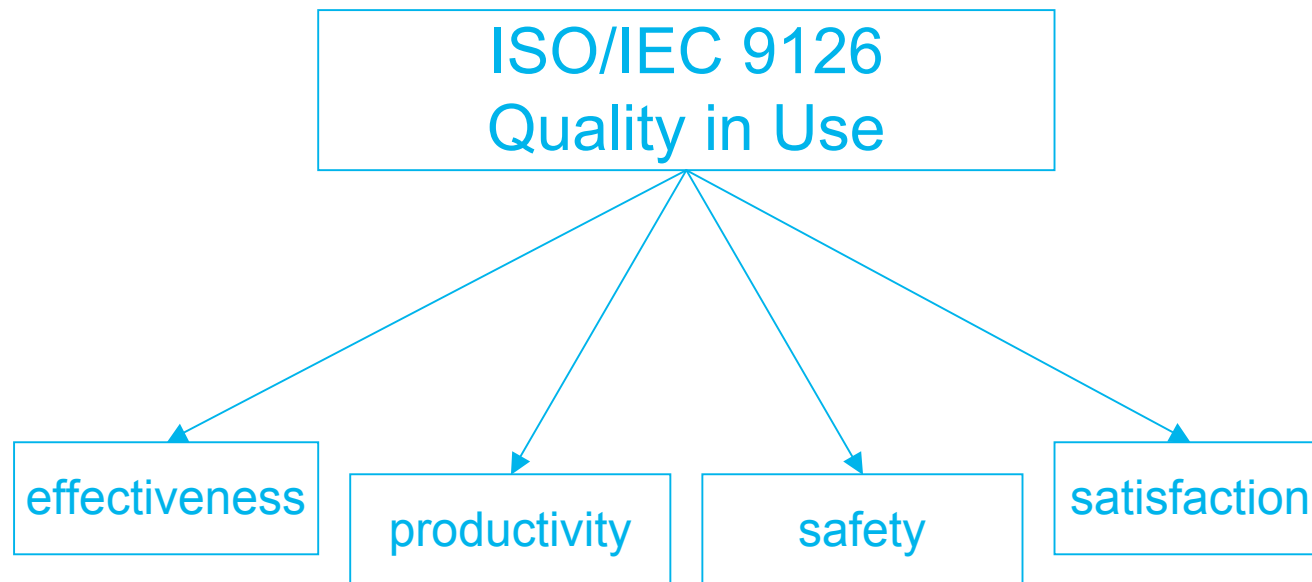

58 | 112

- *Maturity*: how much has been done to prevent failures?
- *Fault tolerance*: when failure occurs, is it fatal?
- *Recoverability*: when fatal failure occurs, how much effort to restart?

ISO/IEC 9126, Part 1

Product quality model: quality-in-use

ISO 9126

Part 2,3: metrics

External metrics, e.g.:

60 | 112

- Changeability: “change implementation elapse time”, time between diagnosis and correction
- Testability: “re-test efficiency”, time between correction and conclusion of test

Internal metrics, e.g.:

- Analysability: “activity recording”, ratio between actual and required number of logged data items
- Changeability: “change impact”, number of modifications and problems introduced by them

Critique

- Not pure *product* measures, rather *product in its environment*
- Measure *after* the fact
- No clear distinction between functional and technical quality

The issue

Software Improvement Group

61 | 112

- Companies innovate and change
- Software systems need to adapt in the same pace as the business changes
- Software systems that do not adapt lose their value
- The technical quality of software systems is a key element

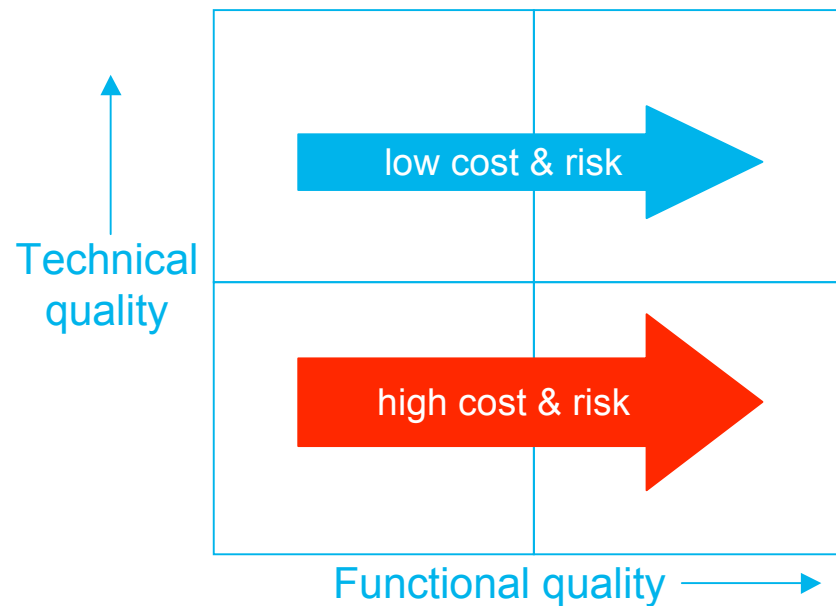

Functional vs technical quality

Software Improvement Group

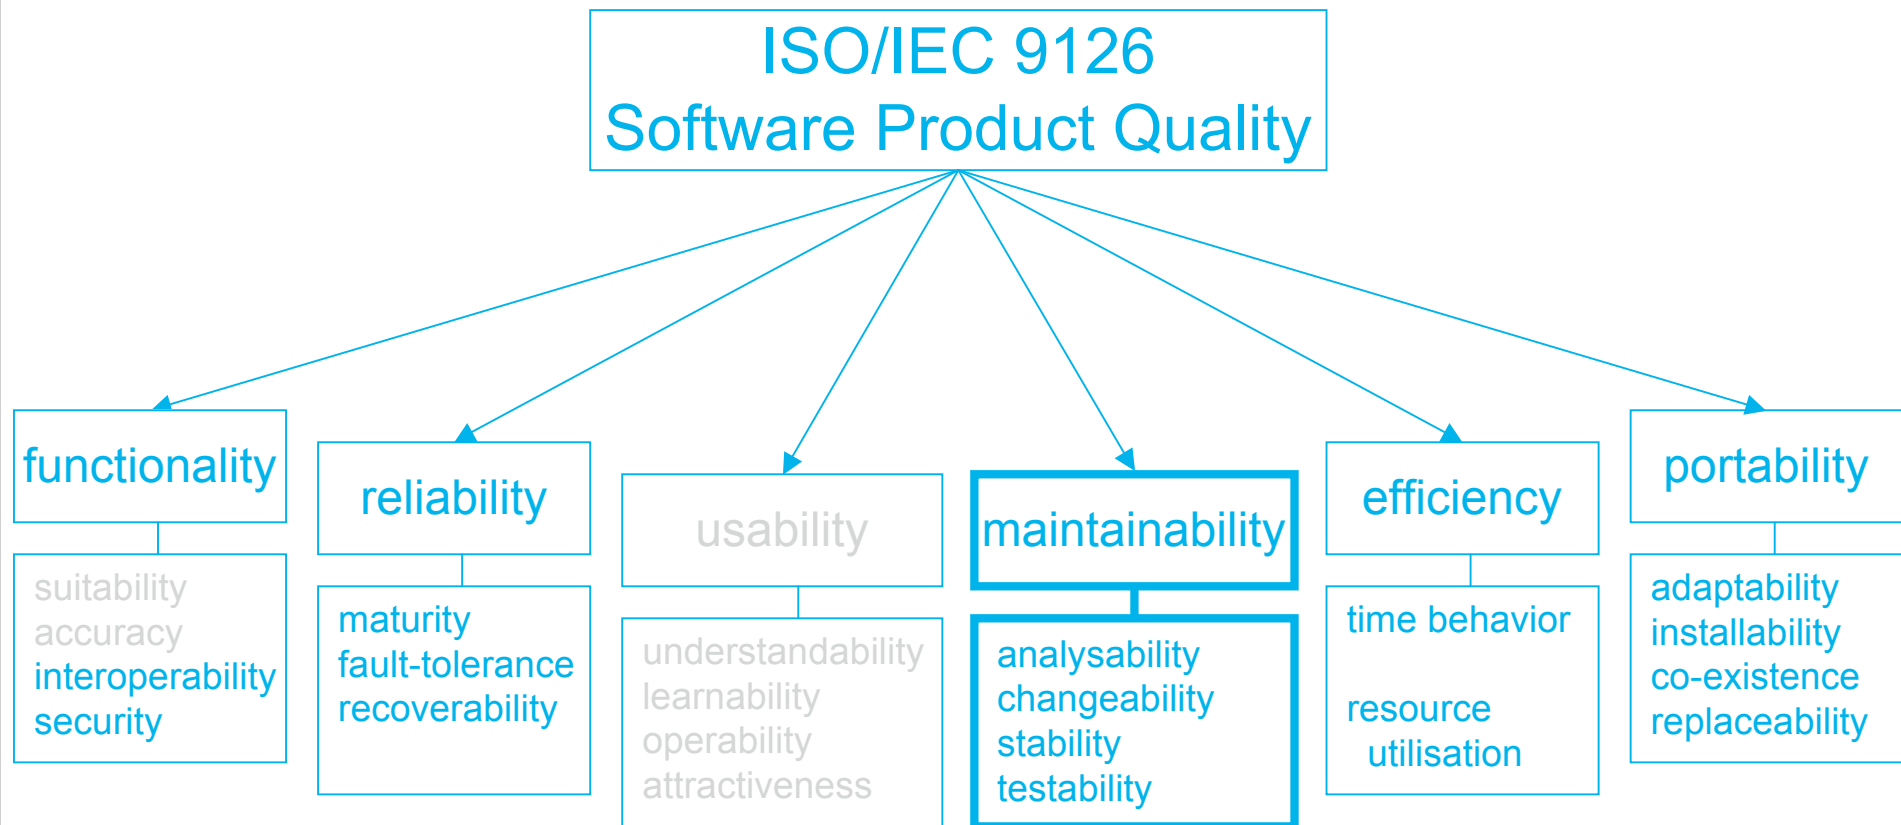

62 | 112

Software with high technical quality can evolve with low cost and risk to keep meeting functional and non-functional requirements.

ISO/IEC 9126, Part 1

Product quality model: technical quality

So ...

Software Improvement Group

64 | 112

What is software quality?

What are the functional and technical aspects of quality?

How can technical quality be measured?

A Challenge

Software Improvement Group

Use source code metrics to measure technical quality?

65 | 112

Plenty of metrics defined in literature

- LOC, cyclomatic complexity, fan in/out, coupling, cohesion, ...
- Halstead, Chidamber-Kemener, Shepperd, ...

Plenty of tools available

- Variations on Lint, PMD, FindBugs, ...
- Coverity, FxCop, Fortify, QA-C, Understand, ...
- Integrated into IDEs

But:

- Do they measure technical quality of a system?

Source code metrics

Lines of code (LOC)

Software Improvement Group

66 | 112

- Easy! Or ...
- SLOC = Source Lines of Code
 - Physical (\approx newlines)
 - Logical (\approx statements)
- Blank lines, comment lines, lines with only “}”
- Generated *versus* manually written
- Measure effort / productivity: specific to programming language

Source code metrics

Function Point Analysis (FPA)

Software Improvement Group

67 | 112

- A.J. Albrecht - IBM - 1979
- Objective measure of functional size
- Counted manually
 - IFPUG, Nesma, Cocomo
 - Large error margins
- Backfiring
 - Per language correlated with LOC
 - SPR, QSM
- Problematic, but popular for estimation

Table 2. Sample Function Point Calculations

| <u>Raw Data</u> | <u>Weights</u> | <u>Function Points</u> |
|--------------------------|----------------|------------------------|
| 1 Input | X 4 = | 4 |
| 1 Output | X 5 = | 5 |
| 1 Inquiry | X 4 = | 4 |
| 1 Data File | X 10 = | 10 |
| 1 Interface | X 7 = | 7 |
| | | ---- |
| Unadjusted Total | | 30 |
| Complexity Adjustment | | None |
| Adjusted Function Points | | 30 |

Source code metrics

Cyclomatic complexity

Software Improvement Group

- T. McCabe, *IEEE Trans. on Sw Engineering*, 1976
- Accepted in the software community
- Number of independent, non-circular paths per method
- Intuitive: number of decisions made in a method
- 1 + the number of if statements (and while, for, ...)

68 | 112

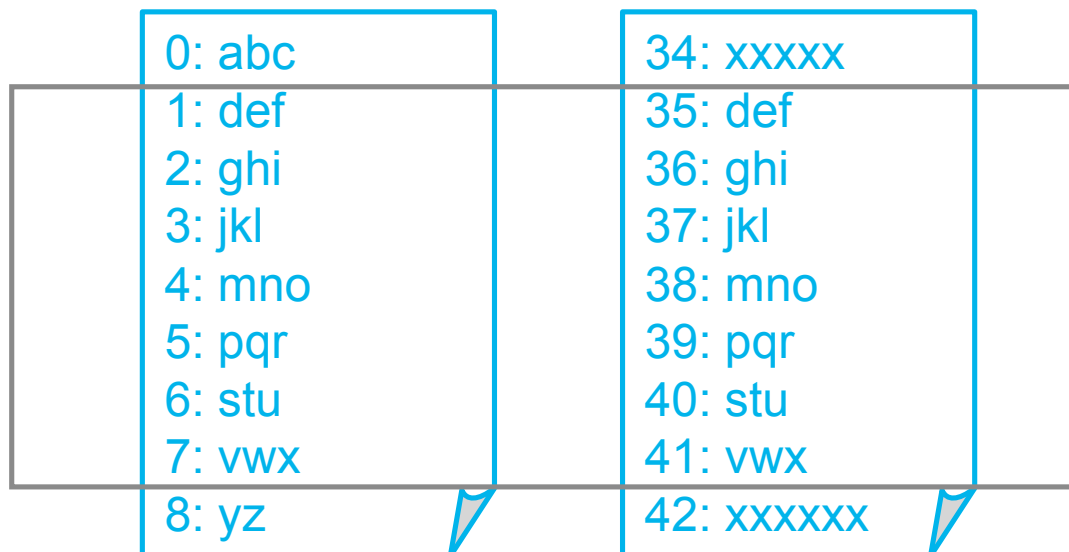

Code duplication Definition

Software Improvement Group

Code duplication measurement

69 | 112

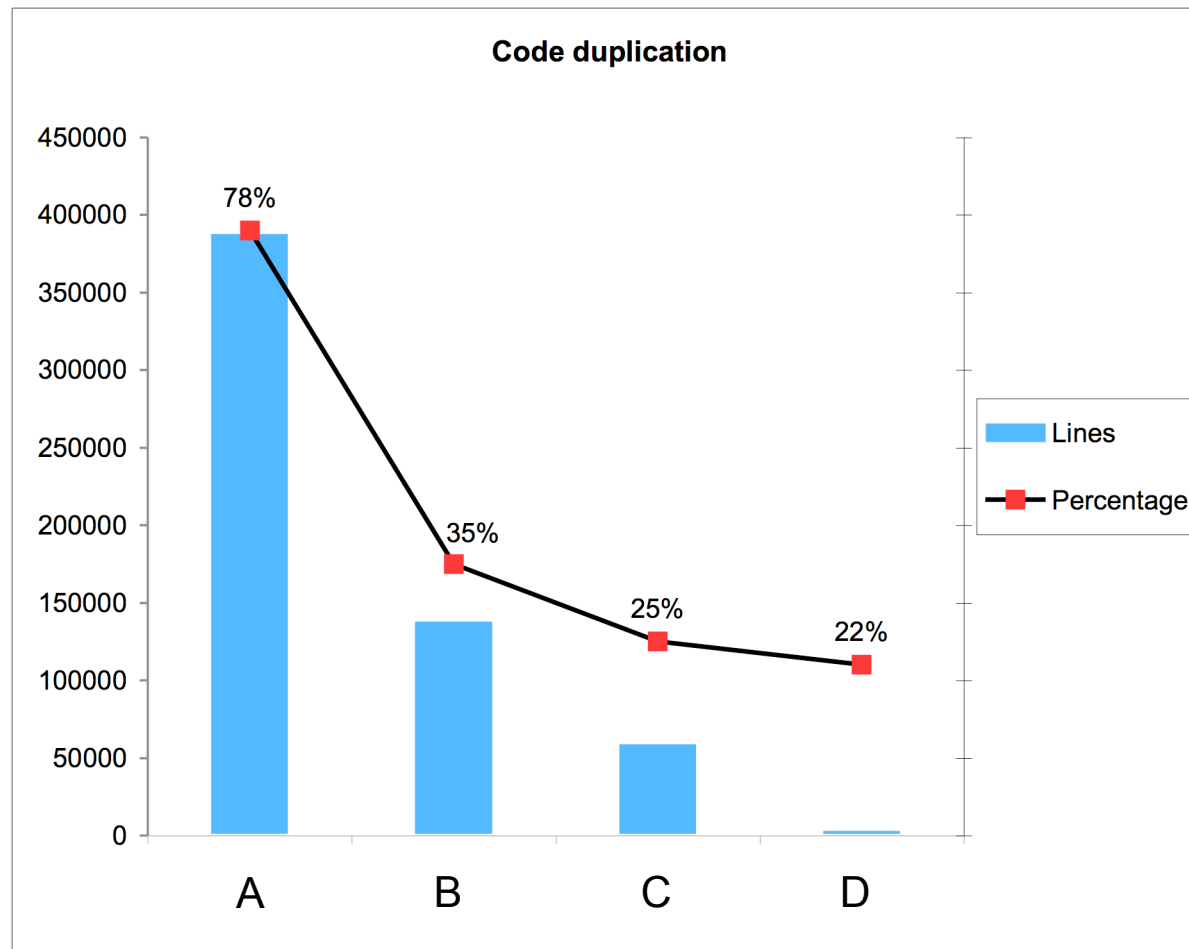

Number of
duplicated lines:
14

Code duplication

Software Improvement Group

70 | 112

Source code metrics

Coupling

Software Improvement Group

- Efferent Coupling (C_e)
 - How many classes do I depend on?
- Afferent Coupling (C_a)
 - How many classes depend on me?
- Instability = $C_e / (C_a + C_e) \in [0, 1]$
 - Ratio of efferent *versus* total coupling
 - 0 = very stable = hard to change
 - 1 = very instable = easy to change

Figure 1. Coupling graph

Table 1. Results of compiling a single class

| Class to Compile | Other Classes Compiled | Afferent Couplings | Efferent Couplings | Instability Factor |
|------------------|------------------------|--------------------|--------------------|--------------------|
| A | B,C,D,E | 0 | 4 | 1 |
| B | C,D,E | 1 | 3 | 0.75 |
| C | - | 2 | 0 | 0 |
| D | E | 3 | 1 | 0.25 |
| E | D | 3 | 1 | 0.25 |

Software metrics crisis

How does measurement data lead to information?

Software Improvement Group

Plethora of software metrics

72 | 112

- Ample definitions in literature
- Ample tools that calculate

Measurement yields data, not information

- How to aggregate individual measurement values?
- How to map aggregated values onto quality attributes?
- How to set thresholds?
- How to act on results?

SIG quality model handles these issues in a pragmatic way

The statistical nature of software metrics

Averaging is fundamentally flawed

Average

73 | 112

- Is measure for *central tendency*
- For “symmetric” distributions, such as *normal*. But:

The statistical nature of software metrics

Emphasize area of risk

Exploit a-symmetry

74 | 112

- High-risk code is on the right
- Weighing with LOC

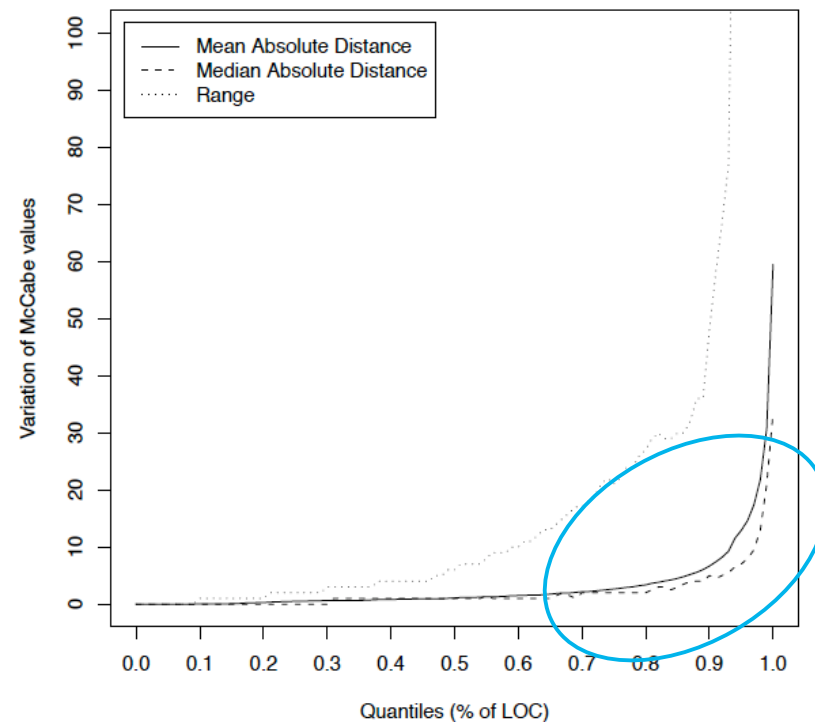

The statistical nature of software metrics

Go where the variation is

Software Improvement Group

75 | 112

Observe for all:

- Systems are similar in low percentiles. Systems differ in higher percentiles.
- Interesting differences occur mostly above the 70% percentile

The statistical nature of software metrics

Go where the variation is

Similar for most source code metrics

SIG Quality Model

Quality profiles

Software Improvement Group

77 | 112

1. Measure source code metrics per method / file / module
2. Summarize distribution of measurement values in “Quality Profiles”

| Cyclomatic complexity | Risk category |
|-----------------------|---------------|
| 1 - 10 | Low |
| 11 - 20 | Moderate |
| 21 - 50 | High |
| > 50 | Very high |

Sum lines of code per category

| Lines of code per risk category | | | |
|---------------------------------|----------|------|-----------|
| Low | Moderate | High | Very high |
| 70 % | 12 % | 13 % | 5 % |

Quality profiles

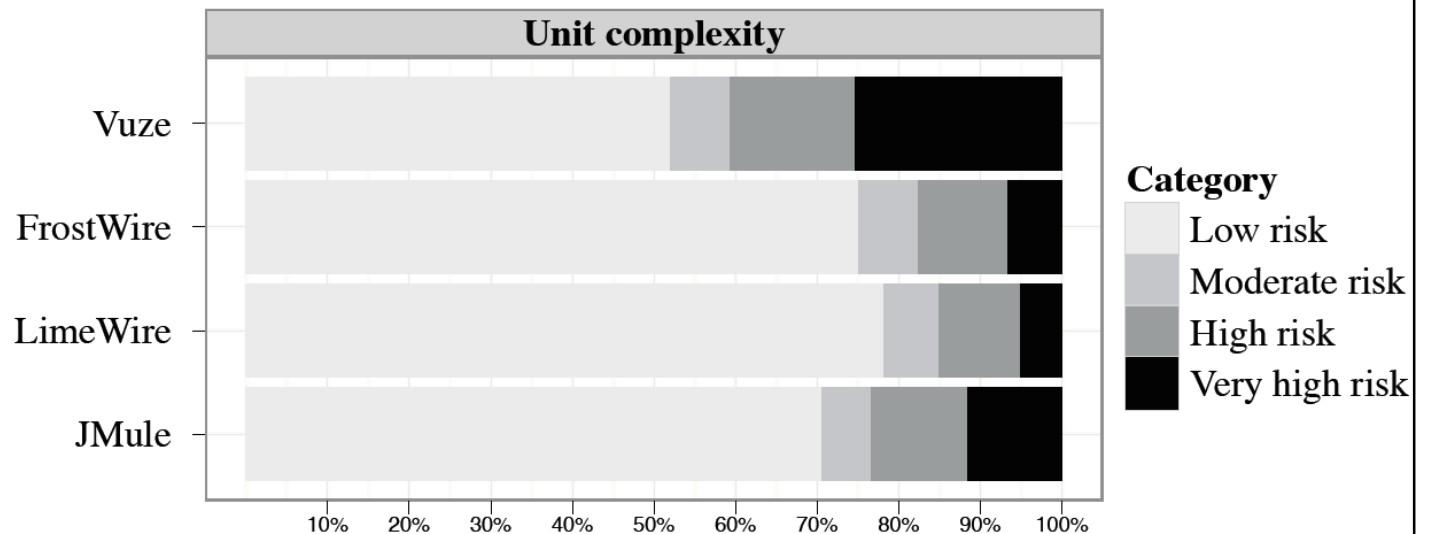

Comparing systems

Software Improvement Group

Aggregation by averaging is fundamentally flawed

78 | 112

Quality profiles, in general

Software Improvement Group

Input

79 | 112

- type Input metric = Map item (metric,LOC)

Risk groups

- type Risk = Low | Moderate | High | Very High
- risk :: metric → Risk

Output

- type ProfileAbs = Map Risk LOC
- type Profile = Map Risk Percentage

Aggregation

- profile :: Input metric → Profile

SIG Quality Model

How do measurements lead to ratings?

Software Improvement Group

A practical model for measuring maintainability

80 | 112

Heitlager, Kuipers, Visser in QUATIC 2007, IEEE Press

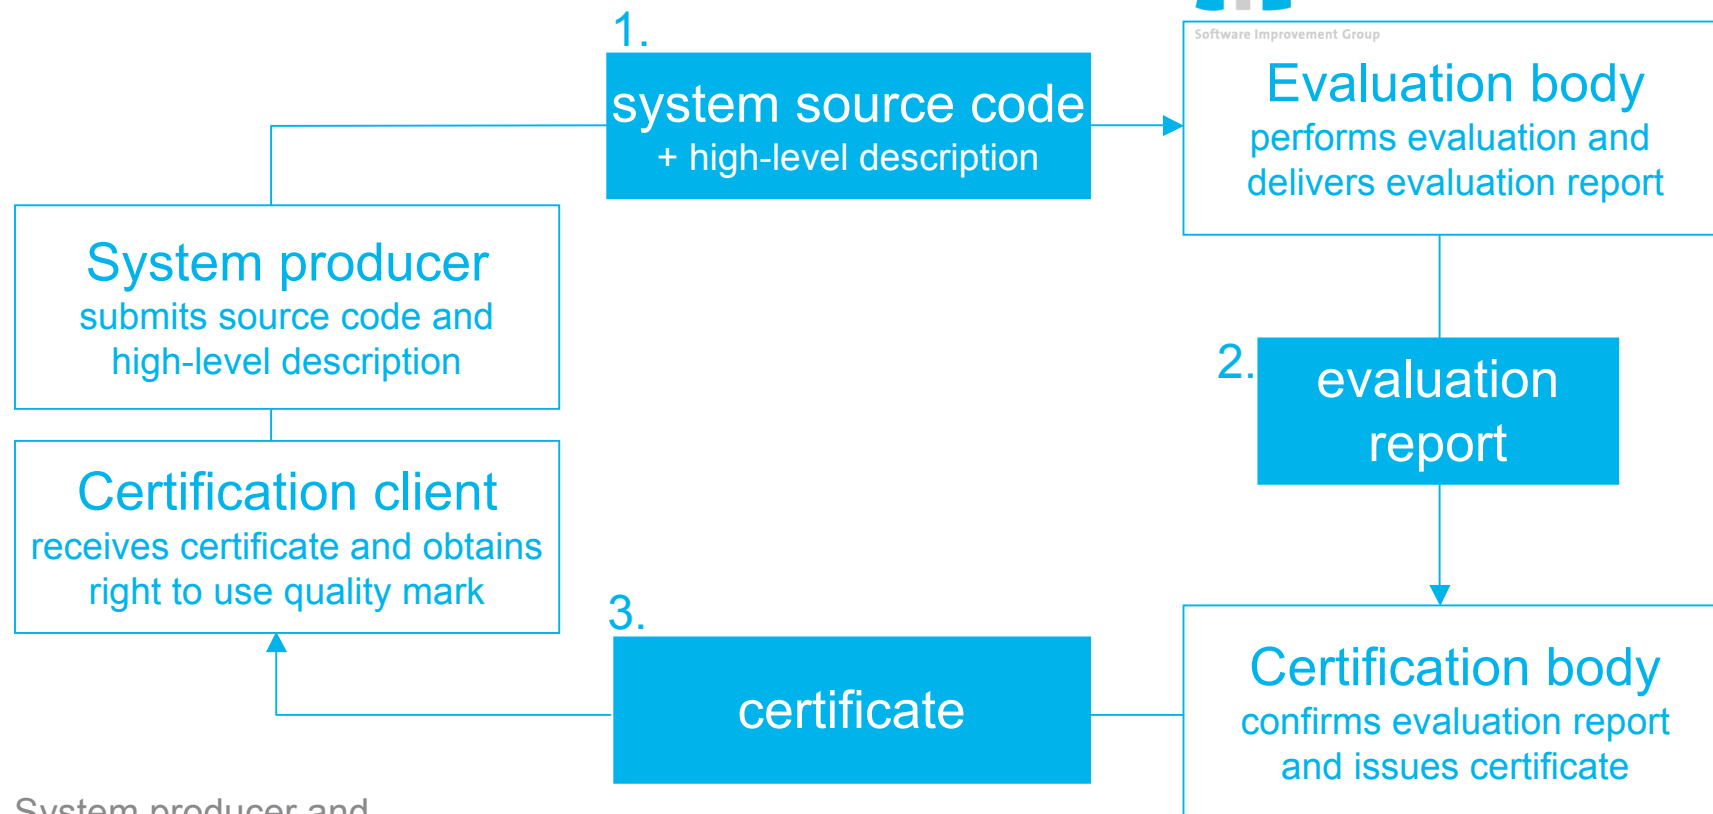

- Aggregate measurements into “Quality Profiles”
- Map measurements and quality profiles to ratings for system properties
- Map ratings for system properties to ratings for ISO/IEC 9126 quality characteristics
- Map to overall rating of technical quality

Software product certification by SIG and TÜViT

81 | 112

System producer and certification client can be the same organization

Evaluation report

82 | 112

- Defines scope of the evaluation
- Summarizes measurement results
- Provides ratings (properties, quality, and overall)
- May provide hints for the producer to improve ratings

Certificate

- States conformance to *SIG/TÜViT Evaluation Criteria*
- Confers right to use quality mark “TÜViT Trusted Product *Maintainability*”

Mapping System Properties to ISO/IEC 9126 Maintainability Characteristics

J.P. Correia, Y. Kanellopoulos, J.Visser. SQM 2009.

Assignment

84 | 112

- “Can we scale from 100 to 100,000 customers?”
- “Should we accept delay and cost overrun, or cancel the project?”

Analysis

- Source code: understanding (reverse engineering) + evaluation (quality)
- Interviews: technical + strategic

Reporting

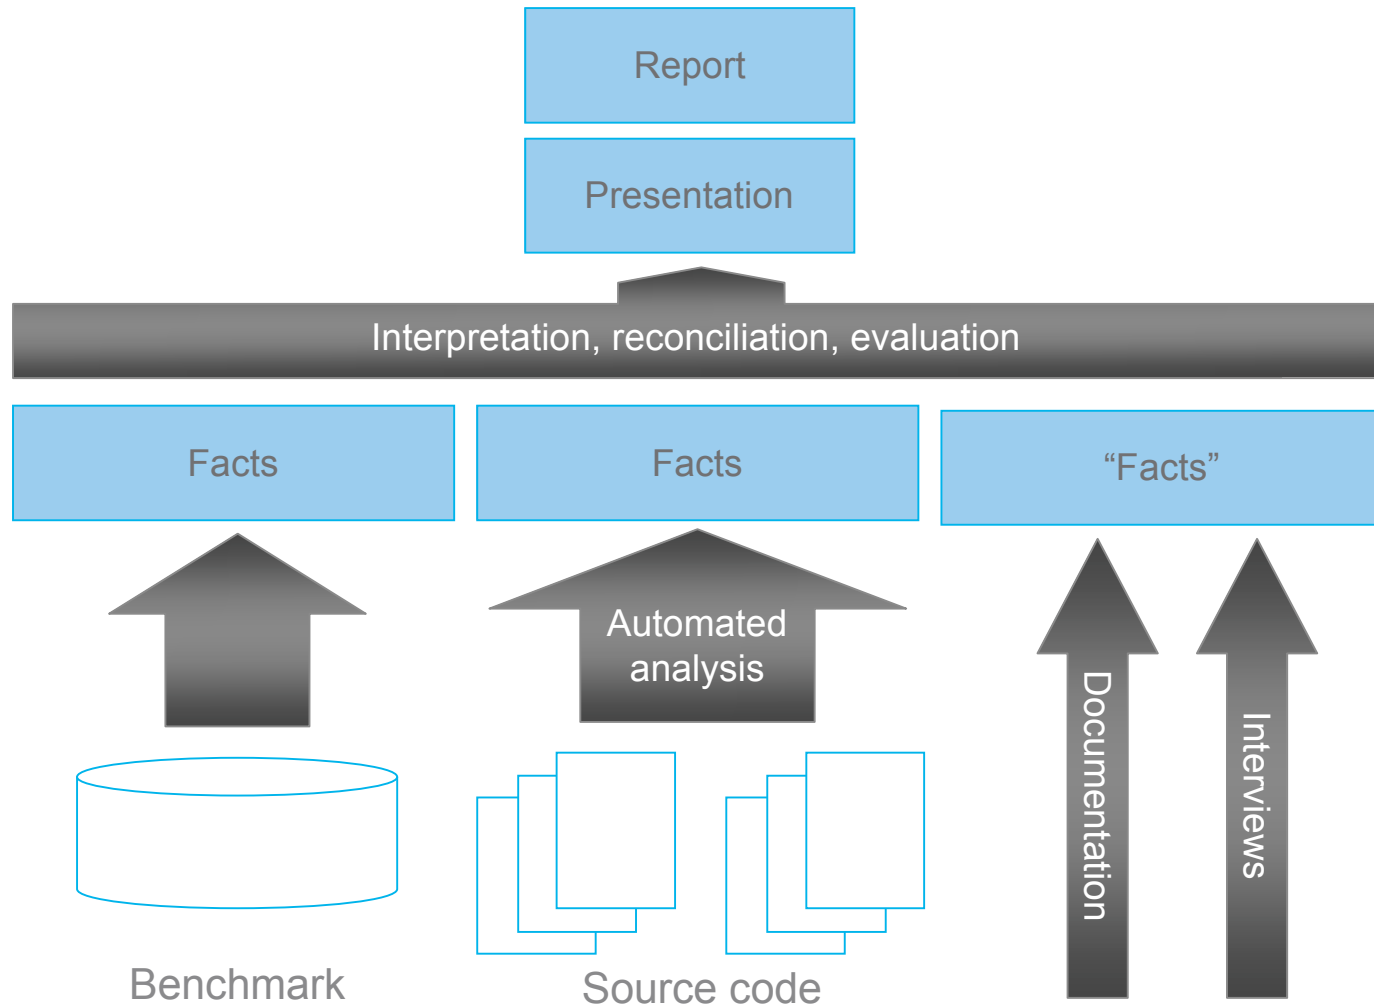

- Quality judgment using star ratings
- Risk analysis putting quality findings in business perspective
- Recommendations to mitigate risks

Software Risk Assessment

Software Improvement Group

85 | 112

Software Risk Assessment

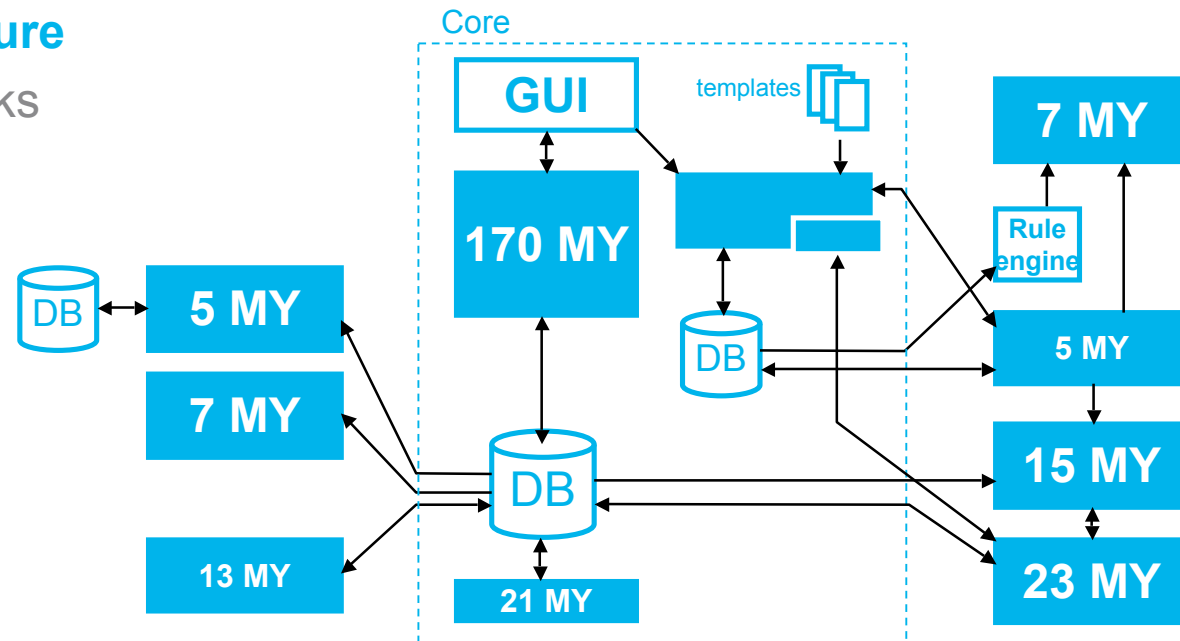

Example: stagnation before go-live

Software Improvement Group

Internal architecture

- Technology risks
- Rebuild value
- Quality

86 | 112

Results

- Insurmountable stability issues, untestable, excessive maintenance burden
- Now: reduce technical complexity, partially automate deployment
- Start planning replacement

Quality roadmap

87 | 112

- “complexity from 2 to 4 stars by 3rd month” in maintenance project
- “final product shall be 4 stars” in development project

Dashboard

- Regular analysis of source code typically once per week
- Shown on dashboard with overviews and drill down possibilities

Consultancy

- Regular reports (presentation and/or written)
- Guard quality agreements, meet quality targets.
- Identify risks and opportunities

Software Monitor

Dashboard

Software Improvement Group

Software Improvement Group

Duplication

89 | 112

Complexity

From client testimonial:

- “Technical quality: as it improves adding functionality is made easier”
- “As quality was increasing, productivity was going up”

What should you remember (so far) from this lecture?

Software Improvement Group

Testing

90 | 112

- Automated unit testing!

Patterns

- Run tools!

Quality and metrics

- Technical quality matters in the long run
- A few simple metrics are sufficient
- If aggregated in well-chosen, meaningful ways
- The simultaneous use of distinct metrics allows zooming in on root causes
